

What's Coming Next to VanguardFX

A look at what we're building next — for artists who want more control, more speed, and more ways to sync to sound.

● **IN DEVELOPMENT** Target: within the next 30 days

Lyric Sync

A new sync mode that reacts to vocal timing and lyric structure — not just frequency bands — so lights, materials, and geometry can pulse in time with the words themselves, not just the beat.

FX Preset Library

Save your favorite DSP, LSP, and MSP setups as presets, reload them instantly in any project, and share preset files with other VanguardFX users.

Faster Analysis on Long Tracks

Optimizing the DSP engine so multi-minute tracks and full songs analyze noticeably faster, with a smoother real-time preview while scrubbing.

In-App Quick Start Guide

A guided first-run walkthrough built directly into DSP, LSP, and MSP — load audio, pick a band, see it react, in under 10 minutes.

● **PLANNED** Next up, after the items above

Batch / Multi-Track Converter

Process an entire album or a full folder of tracks in one pass through the Converter tab, instead of one file at a time.

Expanded FX Pattern Library

New built-in mask patterns added on top of the current 35, for more variety when driving lights, materials, and geometry.

Deeper tyFlow Integration

Refined presets and volume grid behavior tuned to tyFlow's latest release, plus a smoother bake-to-tyCache workflow.

Ongoing Stability Passes

Continued reliability work across DSP, LSP, and MSP based on real user feedback — fewer edge-case freezes, smoother long sessions.

A NOTE ON TIMELINES • HONEST BY DESIGN

This roadmap reflects our current priorities and active development — not a guaranteed release schedule. Building something like Lyric Sync well (not just fast) sometimes takes longer than planned, and we'd rather ship it right than rush it to hit a date. We'll keep this page updated as each feature moves from development to release.
